Abstract
In conversations with their peers, children can often question, discuss, and explore the world for themselves. Children's peer interactions provide a context for learning that is relatively unconstrained compared with, for example, interactions with adults who are typically seen by children as sources of knowledge, expertise, authority and power. In this lecture I will describe a body of work that has examined how children interact, what gets in the way of effective interaction, and what promotes positive learning and peer relationships.
